

Video 1 — App Tour (~2:50)

Target: under 3 minutes. ~430 words, normal speaking pace.

Before recording: hard-reload the page so you land on dark theme, full court, Zones layer. Clear any active filters.

Time	Do this	Say this
0:00	Landing page, don't touch anything	"Kings Shot Lab — 8,816 shots, twelve players, a full 2024-25 season. It's a static site: no backend, no database. Six headline numbers up top, the court in the middle, distance mix and shot diet on the right."
0:15	Hover Corner 3 Left	"Zones are coloured by efficiency against the selection average — blue below, red above. Hover anything for the full breakdown: 480 corner threes, 61.6% eFG, nine and a half points above average."
0:30	Click Restricted Area , pause, then Reset all filters	"And the chart is also navigation. Click a zone and the entire dashboard filters to it — every other panel follows."
0:45	Click Hexes	"Same slice, three ways. Hexes are the classic NBA chart — size is volume, colour is efficiency. Two channels, so 'shoots a lot and misses' reads differently from 'rare but hot'."
1:00	Click Shots , hover around the rim	"Shots drops to raw evidence — every attempt, filled for made, open for missed. Hover uses a quadtree for nearest-point lookup, so it stays instant across thousands of marks instead of scanning them all."
1:15	Open filter rail, click 2–3 chips, drag the divider	"Every filter carries a live count, so you can see a dead end before you click it. The rail is drag-resizable and remembers its width."
1:30	Point at Assisted toggle	"This one has a story — it filters on <i>assist opportunity</i> , not the raw assist flag. The raw flag only exists on made shots, so filtering by it would force shooting percentage to a hundred. More on that in the code video."
1:45	Click Copy link , show the URL bar	"Whatever slice you build lives in the URL. Copy link hands someone the exact view you're looking at — filters and active tab included."
2:00	Click Efficiency , point at matrix	"Shot quality is two-variable, so the centrepiece is shot type against defensive pressure. The same layup is 1.84 points open and 0.88 heavily contested. That's a contest tax of 0.56 a shot — and 64% of our attempts come under heavy pressure."
2:20	Scroll to insights	"Play types ranked by value, then the findings written out in plain English — all recomputed live as you filter."
2:35	Click Player vs Team , click Player C	"Four-quadrant player profile. Card top-left, roster scatter top-right, and the two questions that actually matter at the bottom: is he better here, and does he go here more often. Player C is plus 121 points against team rates — 50% at the rim, zero threes."
2:50	Toggle Light	"Light and dark both supported. That's the tour."

Notes

- **Player C** is the most striking outlier (57.5% eFG, 0% 3PA rate). Player D is the mirror image at –125 points added if you'd rather end on a negative.
- Numbers quoted above are for the **unfiltered** dataset. If you leave a filter on, they change — reset before the Efficiency segment.
